1. General

The CV-M91 3 CCD RGB color camera is a new updated version of CV-M90. The prism is improved, and new CCD sensors are used. The new CCD sensor has 5 dB higher sensitivity, 15 dB lower smear and 4 dB higher dynamic range. Now there are Y/C output and input for composite sync. Pulse width control shutter is now fully implemented.

CV-M91 is a 3 CCD RGB color camera designed for machine vision and image processing applications where excellent resolution, high quality color reproduction are required. The compact 3 CCD C-mount optical prism unit is designed for high color quality, and it allows use of a wide range of C-mount lenses.

CV-M91P is the CCIR PAL version, and CV-M91N is the EIA NTSC version.

Revision B has been updated with new boards.

Revision C has improved timing jitter specifications.

The latest version of this manual can be downloaded from: www.jai.com The latest version of Camera Control Tool for CV-M91 can be downloaded from: www.jai.com

For camera revision history, please contact your local JAI distributor.

2. Standard Composition

The standard camera composition consists of the camera main body.

3. Main Features

- 3 CCD camera for vision applications
- 3 x 1/3" Hyper HAD CCD sensor
- CCIR: 752 (h) x 582 (v) pixels. EIA: 768 (h) x 494 (v) pixels
- Compact RGB prism for C-mount lenses
- Accepts standard C-mount lenses
- RGB output. PAL/NTSC Y/C and composite video output
- 570 TV lines horizontal resolution. S/N >54 dB
- CCD iris and AGC for automatic regulation
- Manual or one push white balance
- Interlaced / non-interlace. Frame or field accumulation
- Edge pre-select and pulse width control external trigger modes
- Start/stop exposure and long time exposure by external VD interval
- Internal or external synchronization on HD/VD or composite video
- Composite sync output or input
- HD/VD, WEN, EEN and pixel clock for easy interface
- Setup by switches or via serial port
- Setup by Windows 98/NT/2000 software via RS 232C

4. Locations and Functions

- 1. Prism
- 2. Lens mount (C-mount). Thread max 4 mm
- 3. Switch SW1 for mode settings
- 4. 6 pin Trigger input and RS-232C connector
- 5. 12 pin DC in/Sync connector
- 6. 9 pin Sub-D connector for video
- 7. Red gain potentiometer
- 8. Blue gain potentiometer
- 9. Switch for one push white balance
- 10. Mounting hole 1/4" for tripod. $\frac{1}{4}$ 20
- 11. M3 mounting holes 4x

Fig. 1. Locations

5. Pin Assignment

5.1. 12-pin Multi-connector (DC-IN/Trigger)

Type: HR10A-10R-12PB-01(Hirose) male. Plugs for cable: HR10A-10P-12S (Seen from rear of camera.)

Fig. 2. 12-pin connector.

-357			
Pin no.	Signal	Remarks	
1	GND		
2	+12 V DC input		
3	GND	N/C on old revision	
4	NC/ VBS video out	*), VBS 75 Ω source SW604-1 on for VBS out	
5	GND		
6	<i>HD in</i> /HD out	75 Ω term. By SW301-1 *), HD out 75 Ω source

10	GND		
11	+12 V DC input		
12	GND		

Notes:

Factory setting in **bold italic**.

*) Alternative signal by internal switch/jumper Refer to "7. Configuring the Camera."

5.2. 6-pin Multi-connector (TRIGGER and RS232C)

Type: HR10A-7R-6PB (Hirose) male Plugs for cable: HR10A-7P-6S Seen from rear.

Fig. 3. 6-pin connector.

Pin no.	Signal	Remarks
1	TXD out	RS-232C
2	RXD in	RS-232C
3	GND	
4	EEN output	75 Ω source
5	Trigger input	75 Ω termination by int. switch SW301-3
6	WEN output	75 Ω source

Notes:

Refer to "7. Configuring the Camera."

EEN (Exposure Enable) pulse indicates the duration of the shutter, and can be used for controlling strobe illumination.

EEN will be low all the time in normal continous mode if the shutter is off.

WEN (Write Enable) pulse indicates the period of effective video signal output. It is usefull for setting the timing with framegrabber.

For schematic diagram of the input and output circuit with alternative settings refer to 5.3.

5.3. 9-pin Sub D-connector (Video)

Type: male.

(Seen from rear of camera.)

Fig. 4. 9-pin connector.

7	Sync out or WEN out	75 Ω source *), JP303 o JP304 c for Sync out	
8	GND		
9	C video out	75 Ω source	

Notes:

Factory setting in *bold italic*.

*) Alternative signals by internal switch/jumper.

Refer to "7. Configuring the Camera."

5.4. Input and Output Circuits

In the following schematic diagrams the input and output circuits for video and timing signals are shown.

Video outputs

The video output is a 75 Ω DC coupled circuit. The video DC level for video and video + sync are shown with 75 Ω termination.

Fig. 5. Video output.

HD, VD and Trigger input

The inputs are AC coupled. Input level 4 V \pm 2 V. The trigger input impedance is high. It can be 75 Ω terminated by closing the switch.

Fig. 6. HD, VD and Trigger input.

HD, VD, WEN, EEN and PCLK output

The output circuit for HD, VD, WEN, EEN and PCLK are complementary emitter followers with 75 Ω in series. Output level is 4V. (Non-terminated).

Fig. 7. HD and VD output.

5.5. Prism unit

For best color performance, the lens should be designed for 1/3" 3CCD camera. Otherwise color shading can be a problem.

Fig. 9. Principle for prism unit.

6. Functions and Operations

The different camera modes and functions can be set by switches and jumpers. Some functions like RGB setup and white clip can only be changed via RS-232C. Function names within " " are names used in camera control tool.

6.1. Input/Output of Signals

6.1.1. Input/output of HD/VD

In the default setting the camera will accept external HD/VD signals on pin 6 and 7 of the 12 pin Hirose connector. If external HD/VD is applied, the camera will synchronize to it. If no external sync signals are applied, the camera will operate with its internal x-tal controlled sync. The time requirements to the relation between VD and HD are shown in fig. 10. The input is TTL level as factory setting. It can be 75 Ohm terminated by an internal switch. Internal HD/VD signals can be output on pin 6 and 7 by internal jumper settings. The output is TTL level from a 75-Ohm source. In trigger modes a VD pulse will only be output after an

external trigger pulse.

Refer to "7. Configuring the Camera."

To use this mode:	
Set function on PK8407:	JP305 s, JP306 o for ext. VD input. <i>Factory default</i> .
	JP308 s, JP309 o for ext. HD input. <i>Factory default</i> .
	SW301-1(HD), SW301-2(VD) to OFF for TTL level. <i>Factory default</i> .
	SW301-1(HD), SW301-2(VD) to ON for 75 Ω termination
	JP305 o, JP306 s for int. VD output
	JP308 o, JP309 s for int. HD output
Input/output:	Ext. VD in or int. VD out on pin 7 on 12-pin connector.
	Ext. HD in or int. HD out on pin 6 on 12-pin connector.

If only a composite VS signal is available, it is possible to enable an internal sync separator to separate HD and VD from the composite signal.

To use this mode:

Set jumper on PK8407:JP312 s, JP313 o, JP315 o, JP318 s, JP319 o for HD/VD input. Default.
JP312 o, JP313 s, JP315 s, JP318 o JP319 s for comp. VS input.InputExt. VS (1Vpp $\pm 30\%$) on pin 7 on 12 pin connector.

- External sync system should follow the camera scanning system
- Requirements to HD/VD phase is shown in fig. 10

Fig. 10. Ext. HD and VD phase conditions.

6.1.2. Internal sync out/WEN out

On pin #7 on 9 pin sub-D connector, the factory setting is the internal composite sync signal out. By jumper settings it can be changed to WEN out. Refer to "7. Configuring the Camera."

To use this mode: Set function on PK8407: JP303 o, JP304 s for sync output. *Factory default*. JP303 s, JP304 o for WEN output.

6.1.3. Internal pixel clock out

The internal pixel clock can be output on pin #9 on the 12 pin connector. As factory setting it is not connected.

Refer to "7. Configuring the Camera."

To use this mode: Set function on PK8407: JP310 o, for no pixel clock out. *Factory default*. JP310 s, for pixel clock out.

Important notes on using this mode.

• If not used, the pixel clock should not be output.

6.1.4. VBS out on pin#4 12 pin.

On pin #4 on the 12 pin connector, the video signal can be output as a composite signal. Refer to "7. Configuring the Camera."

To use this mode:

Set function on PK8404: SW604-1 on for VBS video signal out on pin #4 12 pin. *Factory default*. SW604-1 off for no signal out on pin #4 12 pin.

6.1.5. Y out/VBS out on pin#6 9 pin sub-D.

The signal output on pin #6 on the 9 pin sub.D connector can be changed from Y output to composite video output.

Refer to "7. Configuring the Camera."

To use this mode:

Set function on PK8404: SW604-2 off, SW604-3 on for Y out on pin #6 9 pin. Factory default. SW604-2 on, SW604-3 off for VBS out on pin #6 9 pin.

6.1.6. Green out/sync on green on pin#4 9 pin sub-D.

The green signal output on pin #4 9 pin sub-D can be changed to be composite sync on green. Refer to "7. Configuring the Camera."

To use this mode:

Set function on PK8404: SW604-4 off for green video out on pin #4 9 pin. Factory default. SW604-4 on for sync on green out on pin #4 9 pin.

6.2. Trigger Modes

This camera can operate in 5 primary modes. 1 non-triggered, 3 external H synchronous trigger modes and 1 long time integration mode.

- 1. Normal continuous Mode.
- 2. Edge Pre-select Mode.
- 3. Pulse Width Control Mode.
- 4. Start Stop Mode
- 5. Long time integration

Pre-selected exposure. Pre-selected exposure. Pulse width controlled exposure. Exposure start on trigger, end after ext. VD Accumulation controlled by ext. VD interval

In normal continuous mode and edge pre-select mode the shutter time can be selected from the 8 fixed steps. To avoid jitter, the trigger should be synchronized to HD as shown in fig. 11.

Fig. 11. Trigger/HD timing.

Fig. 12. Horizontal timing with ext. HD sync.

6.2.1. Continuous Operation (Non triggered)

Trigger Mode Normal. It is for applications where the camera is continuous running without external trigger. The shutter will work in all 8 steps up to 1/10,000 second. Refer to "7. Configuring the Camera."

To use this mode: Set function:

Trigger mode "Normal". SW1-4 to OFF On PK8407: JP301 open, JP302 open, JP331 short. *Factory setting*. Accumulation to "Frame" or "Field". SW 301-4 to ON or OFF Scanning to "Interlaced" or "Non-Interlaced". SW 1-5 to OFF or ON "Shutter Speed". SW1-1 through 1-3 to optimum Other functions

Important notes on using this mode.

Fig. 13. PAL horizontal timing

Fig. 16. Vertical timing PAL non-interlaced. Field accumulation

6.2.2. Edge Pre-select Mode

The exposure will start at the first HD after the trigger leading edge, and it stops after the selected shutter time, and the resulting video is read out.

An EEN pulse indicate the accumulation time, and a WEN pulse that the resulting video read out. Refer to "7. Configuring the Camera."

To use this mode:

Set function:	Trigger mode to "Edge pre-select". SW 1-4 to ON
	On PK8407: JP301 open, JP302 open, JP331 short. Factory setting.
	Accumulation to "Field". SW 301-4 to OFF
	Scanning to "Non-interlaced". SW 1-5 to ON
	"Shutter Speed". SW 1-1 through 1-3 to optimum
	Other functions
Input:	Ext. trigger to pin 5 on 6-pin connector.
-	Ext HD to pin 6 on 12 pin connector. (If used).

- The duration of the trigger should be >1H. (>64µsec.)
- To avoid 1H jitter it is recommended to synchronize the trigger to HD. (See fig. 11.)
- A new trigger can not be applied before WEN is high

Fig. 19. Vertical timing for edge pre-select PAL

6.2.3. Pulse Width Control Mode

The exposure will start at the first HD after the trigger leading edge, and it stops between the first and second HD after the trigger trailing edge. An EEN pulse indicate the accumulation time, and a WEN pulse indicates that the resulting video is read out. Refer to "7. Configuring the Camera."

To use this mode:

Set function:	Trigger mode to "Pulse width control". SW 1-4 to ON On PK8407: JP301 open, JP302 open, JP311 open . Accumulation to "Field". SW 301-4 on PK8407 to OFF Scanning to "Non-interlaced". SW 1-5 to ON
	Shutter Speed to "1/10,000". SW 1-1 through 1-3 to ON
	Other functions
Input:	Ext. trigger to pin 5 on 6-pin connector.
	Ext HD to pin 6 on 12 pin connector. (If used).

- The duration of the trigger can be >1H to <900H. (>64 μ sec. to <60msec.)
- To avoid 1H jitter it is recommended to synchronize the trigger to HD. (See fig. 11.)
- A new trigger can not be applied before WEN is high

6.2.4. Start Stop Mode

The exposure time is controlled by the interval between the ext. trigger and the ext. VD signal. The exposure starts at the first HD pulse after the falling edge of the ext. trigger, and stops 14.5 H after the falling edge of the VD pulse. It means that the trigger pulse must be applied after the external VD pulse, for exposures less than 14.5 H. The range can be between 1/77 to 1/10,000. The Start/Stop mode is a continuous mode where the VD signal must be given continuously. It is not possible to input external VD randomly.

The difference between interlaced frame and field accumulation can be explained as follow. Both modes have 2 fields output in an interlaced frame. With frame accumulation, the contents in the ODD and EVEN sync fields will come from sensing field 1 and 2 on the CCD sensor. With field accumulation both ODD and EVEN sync fields will contain the signal from sensing field 1 and 2 added together. Non-interlaced field accumulation needs only 1 trigger pulse for each field. Refer to "7. Configuring the Camera."

To use this mode:

Set function:	Trigger mode to "Start Stop". SW 1-4 to OFF
	On PK8407: JP301 short, JP302 open, JP311 short.
	Accumulation to "Field" or "Frame". SW 301-4 to OFF or ON
	Scanning to "Non-interlaced" or "Interlaced". SW 1-5 to ON or OFF
	Shutter Speed to "1/10,000". SW 1-1 through 1-3 to ON
	Other functions
Input:	Ext. trigger to pin 5 on 6-pin connector.
•	Ext. VD to pin 7 on 12-pin connector
	(Ext. HD to pin 6 on 12 pin connector) Option

(Ext. HD to pin 6 on 12-pin connector). Option

- External sync system should follow the camera scanning system
- Requirements to HD/VD phase is shown in fig. 10

6.2.5. Long time integration

The exposure time is the interval between 2 ext. VD pulses sent to the VD input. (Pin No. 7 of the 12-pin connector). The exposure starts after input of the first ext. VD pulse, and ends after the next input of the next ext. VD pulse, which again starts a new exposure. The long time exposure is a continuous process where each external VD will synchronize the camera, stop the exposure, start a new exposure and read out the previous accumulated signal. The exposure time can be selected in intervals of complete vertical timing periods. (Interlaced frame: EIA 525H and CCIR 625H. Non-interlaced field EIA 262H and CCIR 312H). Refer to "7. Configuring the Camera."

To use this mode:	
Set function:	Trigger mode to "Long Time integrationl". SW 1-4 to OFF
	On PK8407: JP301 open, JP302 short, JP311 short.
	Accumulation to "Field" or "Frame". SW 301-4 to OFF or ON
	Scanning to "Non-interlaced" or "Interlaced". SW 1-5 to ON or OFF
	Shutter Speed to "OFF". SW 1-1 through 1-3 to OFF
	Other functions
Input:	Ext. VD to pin 7 on 12-pin connector
	(Ext. HD to pin 6 on 12-pin connector). Option

- The exposure range is from 1 field to ∞. However it is recommended not to use exposure over 2 seconds due visible dark current signals.
- The ext. VD signal should follow the camera sync system and interlace setting.
- Requirements to HD/VD phase is shown in fig. 10.

6.3. Other Functions.

Refer to "7. Configuring the Camera."

- Scanning: SW1-5 on rear selects interlaced or non-interlaced. Non-interlaced PAL = 312H in EVEN field. Non-interlaced NTSC = 262 H in ODD field.
- **Gamma:** SW1-6 on rear for gamma select. Gamma = 1 or gamma =0.45.
- Gain: SW1-7 on rear select manual gain or AGC. Manual gain is set by VR7 on PK8406. In AGC the gain is automatic. The AGC level is set by potentiometer VR3.
- **Control:** SW1-8 on rear selects the camera control mode. Either local by switches, or remote by "Camera Control Tool" via RS-232C. (Should be in position before power on.)

HD/VD in/out:

Jumper JP305 and JP306 on PK8407 are for switching between VD in/VD out. Jumper JP308 and JP309 on PK8407 are for switching between HD in/HD out

75 Ohm termination:

SW301 on PK8407 can terminate signal inputs from TTL to 75 Ω . SW301-1 for HD. SW301-2 for VD. SW301-3 for ext. trigger. (On for 75 Ω .)

- **VD/VS in:** Jumper JP312, JP313, JP315, JP318 and JP319 on PK8407 select ext. HD/VD in or composite signal to the sync separator, which separate HV/VD.
- Sync/WEN: Jumper JP303 and JP304 on PK8407 for Sync or WEN out on pin #7 on 9 pin sub-D.

Sync on green:

SW604 on PK8404 to ON for composite sync signal on green video output.

Pixel clock out:

Jumper JP301 on PK8407 short for pixel clock out on pin #9 on 12-pin connector.

Frame/field accumulation:

SW301-4 on PK8407 for frame or field accumulation.

CCD iris: SW201 on PK8408 to ON for CCD iris function in the regulation. The reference level can be set by potentiometer VR10 on PK8406.

One Push White Balance:

SW202 on PK8408 switch between manual and one push white balance. Manual allows the white balance to be set by R and B potentiometer on rear. One push is done automatic if switch on camera rear is pressed.

Red and Blue gain setting:

R and B gain potentiometer on camera rear is for manual white adjust.

Manual gain:

VR7 on PK8406 is for manual gain setting. *)

CCD iris setting:

VR10 potentiometer on PK8406 is for CCD iris reference level. *)

AGC setting:

VR3 potentiometer on PK8406 is for AGC reference level. *)

The following functions are for RS 232C control only.

Red, Green and Blue gain level. *) Red, Green and Blue white clip level. Will set the clip level. (Normal 800 mV.). *) Red, Green and Blue offset level. Will set the dark level. Normal 20 mV. *)

*) Do not adjust these settings unless you are familiar with color camera adjustments.

7. Configuring the Camera

7.1 Switch settings

The switch positions are shown in factory setting. Names in *bold italic* is factory setting.

7.3. RS-232C control

The CV-M91 camera functions can be set up via the RS-232C port on the 6 pin HR connector. The JAI camera control tool for CV-M91 can be used for it.

To use this mode: Set function:

Control. SW1-8 on rear to ON. RS-232C. (Switch setting before power on).

Other functions

Important notes on using this mode.

Communication setting.

Baud Rate	9600 bps	
Data Length	8 bit	
Start Bit	1 bit	
Stop Bit	1 bit	RS
Parity	None	
Xon/Xoff Control	None	

7.4. CV-M91command list

The following functions can be controlled via the camera control tool.

232C cable

```
Shutter speed
       1/60 to 1/10,000 sec.
Mode
       Normal, random trigger
Scanning
       2.1 interlaced, non-interlaced
Accumulation
       Frame, field
Gamma
       Gamma 1.0, gamma 0,45
AGC
       AGC off, AGC on, manual gain, AGC reference level
CCD iris
       CCD iris on. CCD iris off, CCD iris reference level
White balance
       One push, manual, red gain, blue gain, green gain
White clip level
       Red white clip, blue white clip, green white clip
Offset level
       Red offset, blue offset, green offset
Load user settings
       Load factory, user 1, user 2
Save user settings
       Save user 1, save user 2. (Last saved user settings become default at next power-up.)
```

7.5. Camera Control Tool for CV-M91

From www.jai.com Camera Control Tool for Windows 98/NT/2000 can be downloaded. The control tool contains a camera control program and tools for making your own program. For the integrator and experienced user, the Camera Control Tool is much more than a program with a window interface. It also provides an easy and efficient ActiveX interface built for MS Windows 98, ME, NT and 2000. The OCX interface has the ability to connect to the camera using the serial interface of the PC by reading and writing properties for the camera. This integration requires simple programming skills within Visual Basic, Visual C++ or similar languages in a Microsoft Windows environment.

Below the different windows are shown.

Fig. 40. Window from camera control tool

8. External Appearance and Dimensions

Important notes.

- C-mount thread on lens should be less than 4.0 mm.
- Use only lenses designed for 1/3" 3 CCD cameras.

Fig. 41. Outline.

9. Specifications

9.1. Spectral sensitivity

The resulting relative response for the prism, the IR stop and the CCD sensor characteristics combined.

9.2. Specification table

Dimensions 50 x 60 x 130 mm (HxWxD)						
Weight 480 g						

9.3. CV-M91 Opto-mechanical specifications

Notes : All the measure tolerances indicated below are the worst values.

1) POSITION TOLERANCE OF LENS MOUNT TO CAMERA BODY

2) Position tolerance of Back focal length and Parallelism tolerance of Sensor to Lens mount

3) POSITION TOLERANCE OF SENSOR TO LENS MOUNT

10. Appendix

10.1. Precautions

Personnel not trained in dealing with similar electronic devices should not service this camera. The camera contains components sensitive to electrostatic discharge. The handling of these devices should follow the requirements of electrostatic sensitive components.

Do not attempt to disassemble this camera.

Do not expose this camera to rain or moisture.

Do not face this camera towards the sun, extreme bright light or light reflecting objects. When this camera is not in use, put the supplied lens cap on the lens mount.

Handle this camera with the maximum care.

Operate this camera only from the type of power source indicated on the camera.

Power off the camera during any modification such as changes of jumper and switch setting.

10.2. Typical CCD Characteristics

The following effects may be observed on the video monitor screen. They do not indicate any fault of the CCD camera, but do associate with typical CCD characteristics.

V. Smear

Due to an excessive bright object such as electric lighting, sun or strong reflection, vertical smear may be visible on the video monitor screen. This phenomenon is related to the characteristics of the Interline Transfer System employed in the CCD.

V. Aliasing

When the CCD camera captures stripes, straight lines or similar sharp patterns, jagged image on the monitor may appear.

Blemishes

Some pixel defects can occur, but this does not have en effect on the practical operation.

Patterned Noise

When the CCD camera captures a dark object at high temperature or is used for long time integration, fixed pattern noise (shown as white dots) may appear on the video monitor screen.

11. Users Record

Camera type:	CV-M91
Revision:	(Revision C)
Serial No.

THE MECHADEMIC COMPANY

Supplement

The following statement is related to the regulation on "Measures for the Administration of the control of Pollution by Electronic Information Products ", known as " China RoHS ". The table shows contained Hazardous Substances in this camera.

mark shows that the environment-friendly use period of contained Hazardous Substances is 15 years.

重要注意事项

有毒,有害物质或元素名称及含量表

根据中华人民共和国信息产业部『电子信息产品污染控制管理办法』,本产品《 有毒,有 害物质或元素名称及含量表 》如下.

	有毒有害物质或元素							
部件名称	铅 (Pb)	汞 (Hg)	镉 (Cd)	六价铬 (Cr(VI))	多溴联苯 (PPB)	多溴二苯醚 (PBDE)		
棱镜	×	0	0	0	0	0		
光学滤色镜	×	0	×	0	0	0		
○:表示该有毒有害物质在该部件所有均质材料中的含量均在SJ/T11363-2006规定的限量要求以下。 ×:表示该有毒有害物质至少在该部件的某一均质材料中的含量超出SJ/T11363-2006规定的限量要求。 (企业可在此处、根据实际情况对上表中打"×"的技术原因进行进一步说明。)								

环保使用期限 电子信息产品中含有的有毒有害物质或元素在正常使用的条件下不会发生外 泄动突变。由圣信息亲只用户使用该由圣信息亲只不会对环境造成严重污染

也了信息// 品中咨有的有每有害物质或尤紧在正书使用的采作下不会及至外 泄或突变、电子信息产品用户使用该电子信息产品不会对环境造成严重污染 或对基人身、财产造成严重损害的期限。 数字「15」为期限15年。
